

The Christmas Tree shown in the illustration contains exactly three equilateral triangles.

The object is to move three matches so that to get four equilateral triangles.

Overlapping of the matches is not allowed.

Arrange seven matches into the equation shown in the illustration. It can be seen the equation itself is not correct.

Puzzle 1. Move one match to a new position in order to make this equation correct.

**Puzzle 2.** Move three matches to new positions to get a correct equation. This puzzle can be solved in two different ways.

**Puzzle 3\*.** Move two matches to new positions to get a correct equation.

In all three puzzles it is not allowed to break the matches and an equation sign has to remain in the final expression.

\*The puzzle with a complete solution has been sent to us by Roger Kirkman. Many thanks!

Page 8 of 27

Take eight matches and form the 2x2 square shown in the illustration.

The object is to divide this square with the four additional matches into two parts of the same area and shape.

You have to use matches with their full lengths without cutting, breaking or overlapping them.

The idea of this puzzle appeared in Bryant & May's little book of matchstick puzzles at the beginning of the 20th century.

The illustration above shows two wine glasses arranged from ten matches.

The object is to move six of them in such a way that to get a house instead of these wine glasses.

One of the basic solutions is given in the illustration. When you move the entire bottom triangle of three matches to the new position as shown, the three initial triangles remain plus one additional, smaller, equilateral triangle appears.

The solution to the first puzzle is shown in the upper illustration.

Two different solutions to the second puzzle are shown in the two middle illustrations.

The solution to the third puzzle is shown in the bottom illustration. This solution as well as the puzzle itself was contributed by Roger Kirkman.
